

Attribute Grammar - Identificación

Attributes

Symbol	Attribute Name	Java Type	Inherited/Synthesized	Description
VarDefinition	scope	ENUM { GLOBAL, LOCAL, PARAMETER}	Inherited	Registro del ámbito en el que se ha definido la variable: <ul style="list-style-type: none"> - Global: La variable se ha definido en el bloque global → vars - Local: La variable se ha definido en el bloque local dentro de un feature - Parameter: La variable es un parámetro de una función
Variable	definition	VarDefinition	Synthesized	Enlace a la definición de esta variable
FunctionDefinition	isBuilder	boolean	Synthesized	True si se ha definido la función previamente en el bloque create (constructor). Se usará para verificar que la función puede ser llamada en la llamada run .
FunctionCallSent	definition	FunctionDefinition	Synthesized	Enlace a la definición de la función
FunctionCallExpr	definition	FunctionDefinition	Synthesized	Enlace a la definición de la función
FieldDefinition	fieldOwner	StructType	Inherited	Enlace a la struct en la que se define el campo
StructType	definition	StructDefinition	Synthesized	Enlace a la definición de la Struct
RunCall	definition	FunctionDefinition	Synthesized	Enlace a la definición de la función

Rules

Node	Predicates	Semantic Functions
program → name :string types :structDefinition* vars :varDefinition* builders :functionBuilder* features :functionDefinition* runCall :runCall	builders == ∅	vars.forEach(v -> v.scope= Scope.GLOBAL)
runCall → name :string args :expression*	functions[name] ≠ ∅ functions[name].isBuilder == TRUE	runCall.definition = functions[name]
structDefinition → name :structType fields :fieldDefinition*	structs[name] == ∅	structs.put(name, structDefinition) fields.forEach(f -> f.fieldOwner = structDefinition) structFields = ∅
functionDefinition → name :string params :varDefinition* returnType :type? vars :varDefinition* sentences :sentence*	functions[name] == ∅	variables.set() functions.put(name, functionDefinition) builders[name] ≠ ∅ then { functionDefinition.isBuilder = true builders.remove(name) } else { functionDefinition.isBuilder = false }

		<pre> params.forEach(p -> p.scope = Scope.PARAMETER) vars.forEach(v -> v.scope= Scope.LOCAL) variables.reset() </pre>
fieldDefinition → name :string tipo :type	structFields[name] == ∅	structFields.put(name, fieldDefinition)
varDefinition → name :string tipo :type	<pre> varDefinition.scope == Scope.GLOBAL then { variables.getFromAny(name) == ∅ } else { variables.getFromTop(name) == ∅ } </pre>	variables.put(name, varDefinition)
functionBuilder → name :string	builders[name] == ∅	builders[name] = name
functionCallSent :sentence → name :string args :expression*	functions[name] ≠ ∅	functionCallSent.definition = functions[name]
assignment :sentence → left :expression right :expression		
loop :sentence → from :assignment* until :expression body :sentence*		

ifElse :sentence → condition :expression trueBlock :sentence* falseBlock :sentence*		
read :sentence → input :expression*		
print :sentence → op :string input :expression*		
return :sentence → value :expression?		
intConstant :expression → value :string		
realConstant :expression → value :string		
charConstant :expression → value :string		
variable :expression → name :string	variables.getFromAny(name) ≠ ∅	variable.definition = variables.getFromAny(name)
castExpr :expression → castType :type value :expression		
arithmeticExpr :expression → op1 :expression operator :string op2 :expression		
logicalExpr :expression → op1 :expression operator :string op2 :expression		
comparationExpr :expression → op1 :expression operator :string op2 :expression		
minusExpr :expression → op :expression		
notExpr :expression → op :expression		

functionCallExpr :expression → name :string args :expression*	functions[name] ≠ ∅	functionCallExpr.definition = functions[name]
fieldAccess :expression → root :expression field :string		
arrayAccess :expression → array :expression index :expression		
intType :type → ε		
doubleType :type → ε		
charType :type → ε		
voidType :type → ε		
structType :type → name :string	structs[name] ≠ ∅	structType.definition = structs[name]
arrayType :type → dimension :intConstant tipo :type		

Operators samples (cut & paste if needed):

⇒ ⇔ ≠ ∅ ∈ ∉ ∪ ∩ ⊂ ⊄ ∑ ∃ ∀

Auxiliary Data Structures

Symbol	Java Type	Description
variables	ContextMap<String, VarDefinition>	Conjunto de las variables declaradas

builders	List<String>	Lista de los nombres declarados en el bloque 'create', es decir, los constructores declarados (FunctionBuilder)
functions	Map<String, FunctionDefinition>	Conjunto de las funciones definidas
structs	Map<String, StructDefinition>	Conjunto de los structs (defTuple) declarados
structFields	Map<String, FieldDefinition>	Conjunto de los campos declarados en un struct. Está lista se vacía cada vez que se termina de visitar una definición de Struct.
